

case study:

MID-PROJECT DATA SERVICES RESCUE

Challenge: Data clean-up and reporting under expedited timelines. A company submitting an NDA for a new type of anti-viral drug to be reviewed on a fast track was not satisfied with the services of its existing data services partner. They asked i3 Statprobe to audit and rework the existing database and table programming.

Solution: Use our experience to create a pristine database and output. Our personnel flew out to the existing provider, audited and validated the data, and returned to oversee the database clean-up and lock. Continuing data management was undertaken in Oracle Clinical, while i3 Statprobe's data manager oversaw the design and

development of new study databases to exactly match the client's database specifications. Simultaneously, i3Statprobe statisticians and programmers reworked the output tables to ensure accurate reporting.

Result: A successful conclusion; a returning client. Our team provided a transparent, seemingly effortless transition, from which i3 Statprobe proceeded to support these protocols to a successful conclusion. After drug approval, i3 Statprobe assumed responsibility for all post-marketing studies, and has continued to provide the full range of data services-from data management through to medical writing-on subsequent studies.
